ISS, 4 filters

# 1. Titan ↔ Earth

A dense atmosphere mainly made of  $N_2$ , with a vertical structure analog to that of the Earth

Pressure [hPa]

thermosphere

mesosphere

stratosphere

troposphere

# HASI temperature profile

Altitude [km]

Temperature [K]

# Greenhouse Effects & atmospheric dynamics

*Earth*

*Titan*

**Greenhouse gases**

**Condensable**

**H<sub>2</sub>O**

**CH<sub>4</sub>**

**Non-condensable**

**CO<sub>2</sub>**

**H<sub>2</sub>**

**Antigreenhouse**

**Aerosols  
& clouds**

**Aerosol hazes**

**Polar vortex**

**Ozone layer**

**South pole  
atmospheric chemistry**

**Presence of  $^{40}\text{Ar}$  (Cassini-INMS & Huygens-GC-MS)**

**$\sim 4,3 \times 10^{-5}$  (GC-MS)**

**$\Rightarrow$  secondary atmosphere by degassing ( $^{40}\text{K} \Rightarrow ^{40}\text{Ar}$ )**

**Very small amount of primordial gases**

**$^{36}\text{Ar} : 2.8 \times 10^{-7}$  (GC-MS)**

**other noble gases : Kr and Xe : below  $10^{-8}$  (GC-MS)**

**$\Rightarrow$  Atmosphere initially made of  $\text{NH}_3$**

**$^{14}\text{N}/^{15}\text{N}$  from GC-MS = 183 : < than primordial N**

**$\Rightarrow$  loss of several times the present atmosphere**

**$\Rightarrow$  large organic deposit on the surface**

## Other similarities

volcanic, sedimentological & meteorological origins of several surface features (Huygens DISR; Cassini ISS Radar, VIMS)

**=> A geologically active planet !!**

*Science* 13 May 2005:

Vol. 308. no. 5724, pp. 1014 - 1017

## **A Hydrogen-Rich Early Earth Atmosphere**

**Feng Tian,<sup>1,2\*</sup> Owen B. Toon,<sup>2,3</sup> Alexander A. Pavlov,<sup>2</sup> H. De Sterck<sup>4</sup>**

We show that the escape of hydrogen from early Earth's atmosphere likely occurred at rates slower by two orders of magnitude than previously thought. The balance between slow hydrogen escape and volcanic outgassing could have maintained ***a hydrogen mixing ratio of more than 30%***.

The production of prebiotic organic compounds in such an atmosphere would have been more efficient than either exogenous delivery or synthesis in hydrothermal systems.

**=> Atmospheric organic syntheses may have played an important role in prebiotic chemistry on the early Earth**

## **2. Titan's Organic Chemistry**

# ORGANIC PRODUCTS

## Gas Mixture

## Electrical Discharges

## UV light

- RH (sat & unsat)
- HCN & other RCN (sat)
- RCO<sub>2</sub>H
- H<sub>2</sub>CO, other aldehydes
- Ketones & alcohols)

Solids ==> Amino-acids, N- heterocycles

- RH (mainly sat)
- HCN & other N-organics  
RCN (sat) if N/C <1  
RNH<sub>2</sub> if N/C >1
- H<sub>2</sub>CO, other aldehydes
- Ketones & alcohols)

Solids ==> Amino-acids

- RH (sat & unsat)
- HCN, other RCN (sat & unsat) : HC<sub>3</sub>N & C<sub>2</sub>N<sub>2</sub>
- O-organics including H<sub>2</sub>CO, other aldehydes, ketones & alcohols

Solids ==> Amino-acids, N- heterocycles

- RH (sat & unsat)
- O-organics including H<sub>2</sub>CO & other aldehydes at very low yield

Solids ==> Carboxylic acids

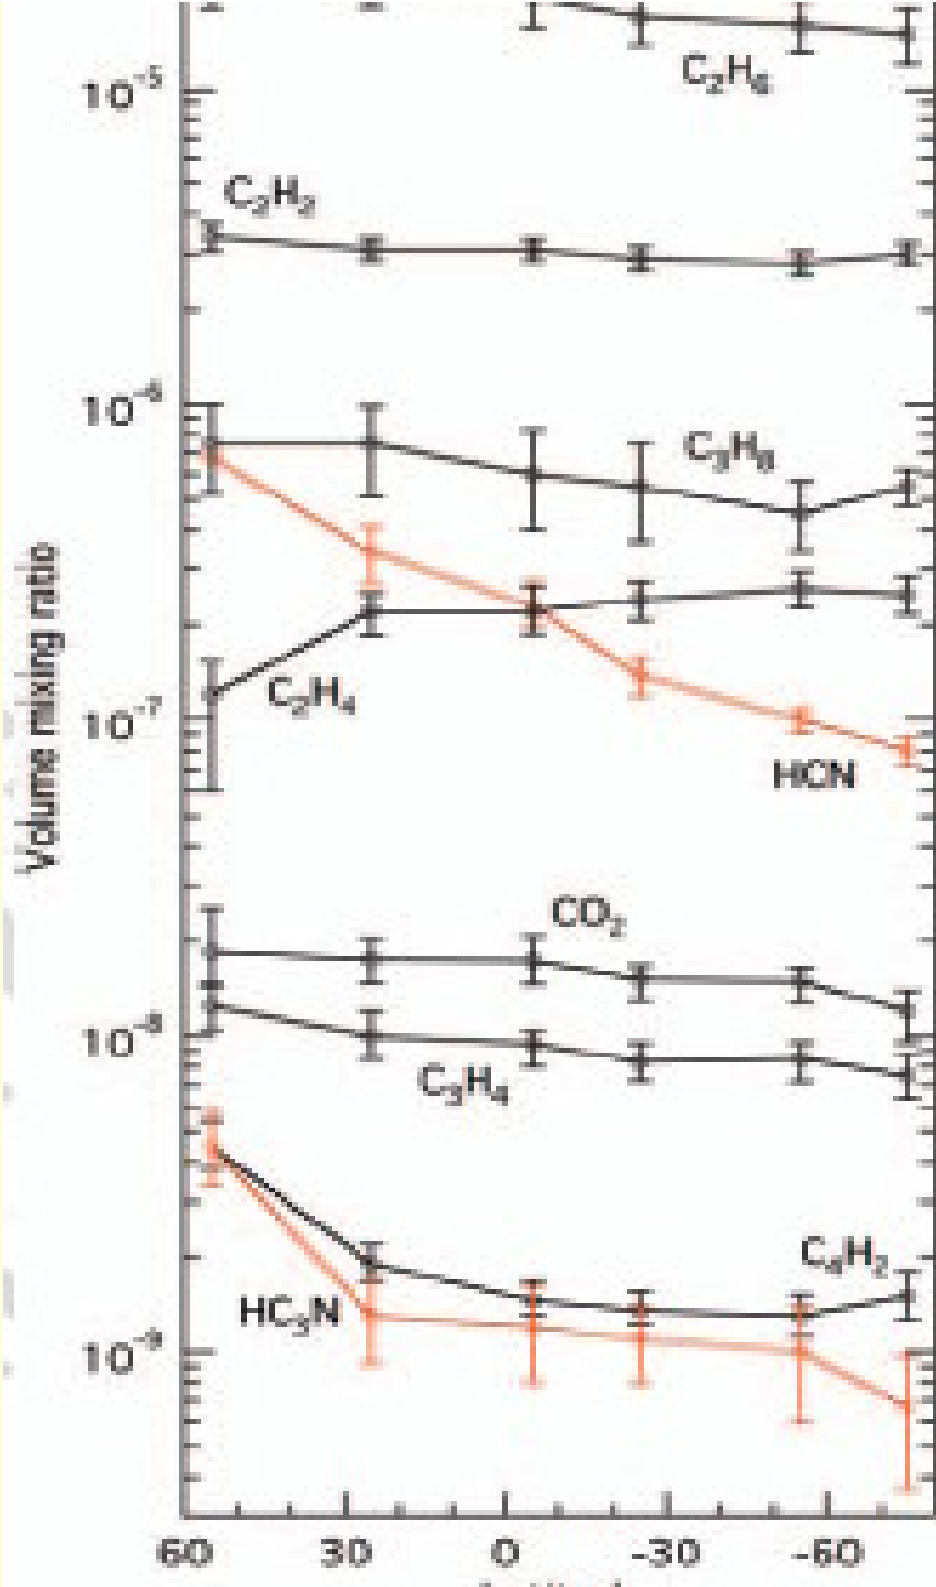

# **SOLID PHASE : THOLINS**

- **Tholins (Carl Sagan, *Nature*, 1979) names the solid organic product obtained after irradiation of gas mixtures of cosmically abundant molecules by energy sources of astrophysical importance**
- **Titan's tholins obtained after irradiation of N<sub>2</sub>-CH<sub>4</sub> gas mixtures = laboratory analogues of Titan's aerosols**

| Compounds                                      | Stratosphere Mixing Ratio<br>(E=Equ.; N=North Pole ) | Production in<br>Simulation Experiments |

**CIRS data**

Flasar et al, *Science* **308**,975 (2005)

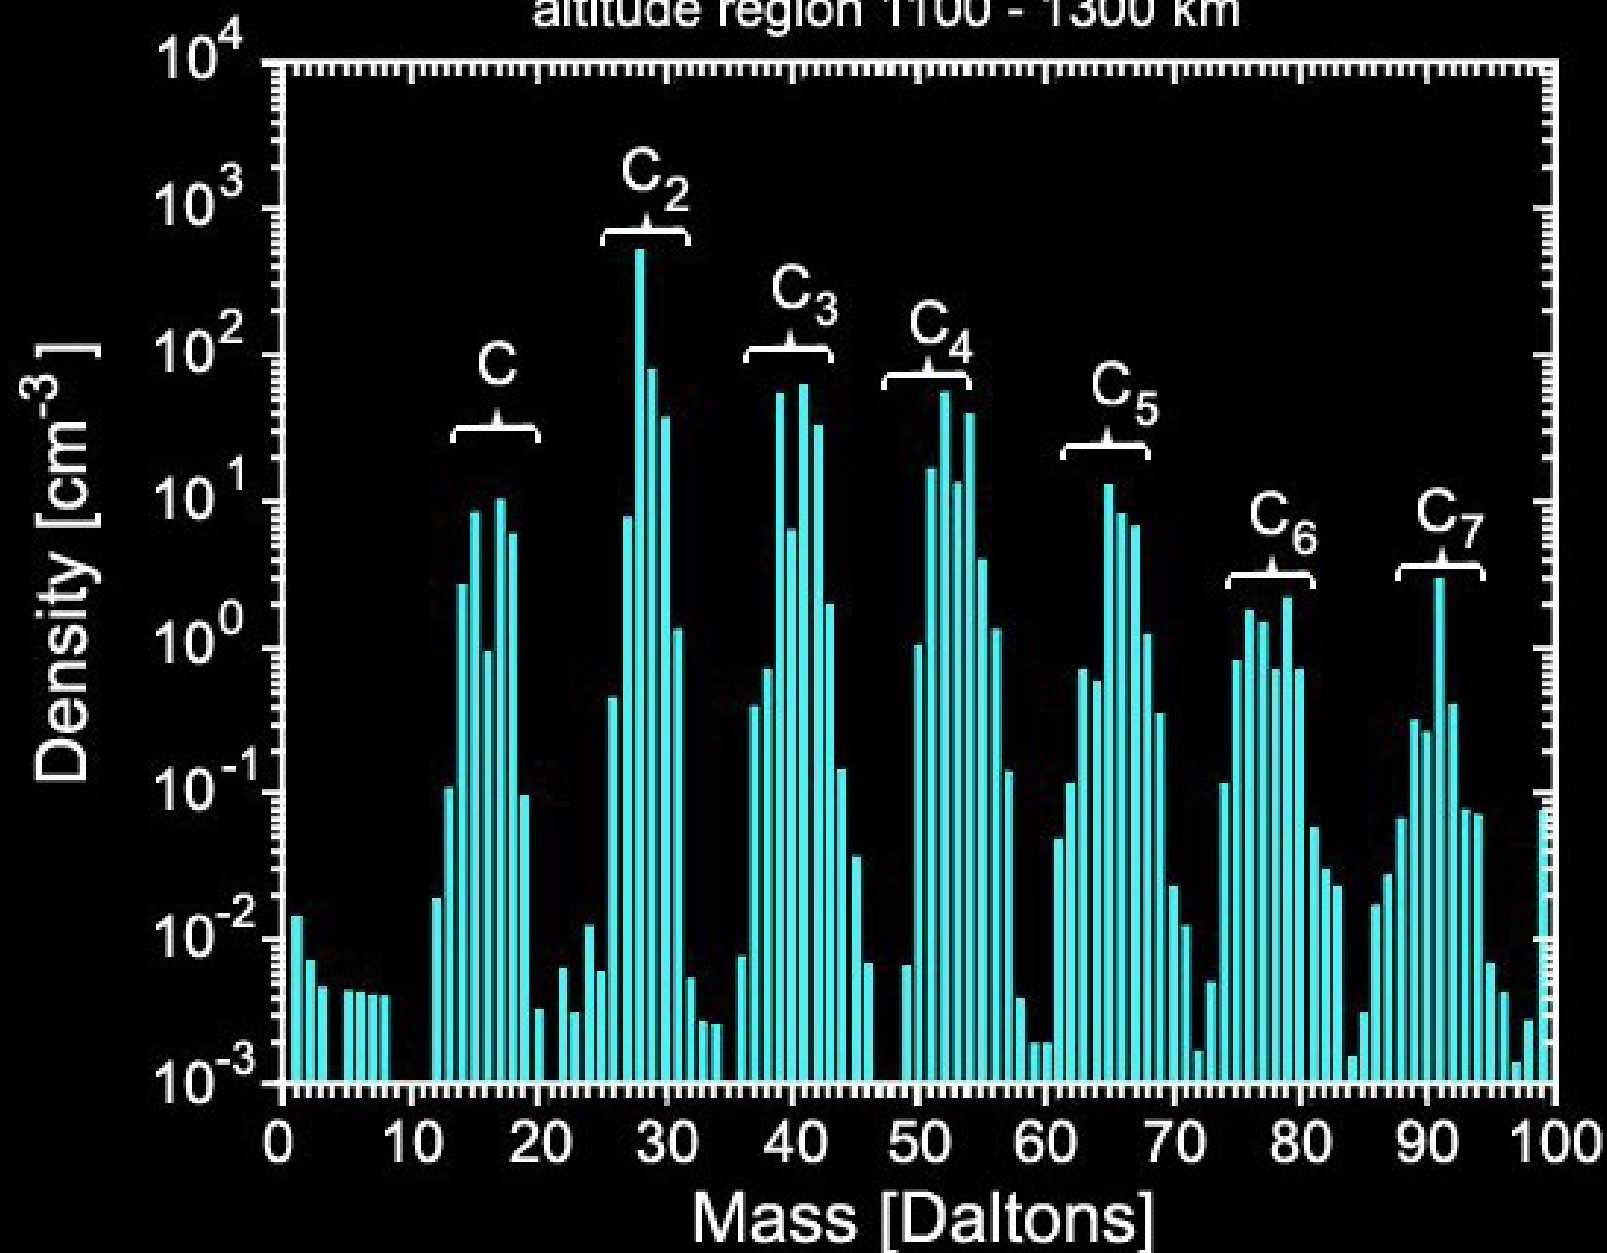

# Huygens GC-MS data

INMS

# Titan's Ionospheric Density

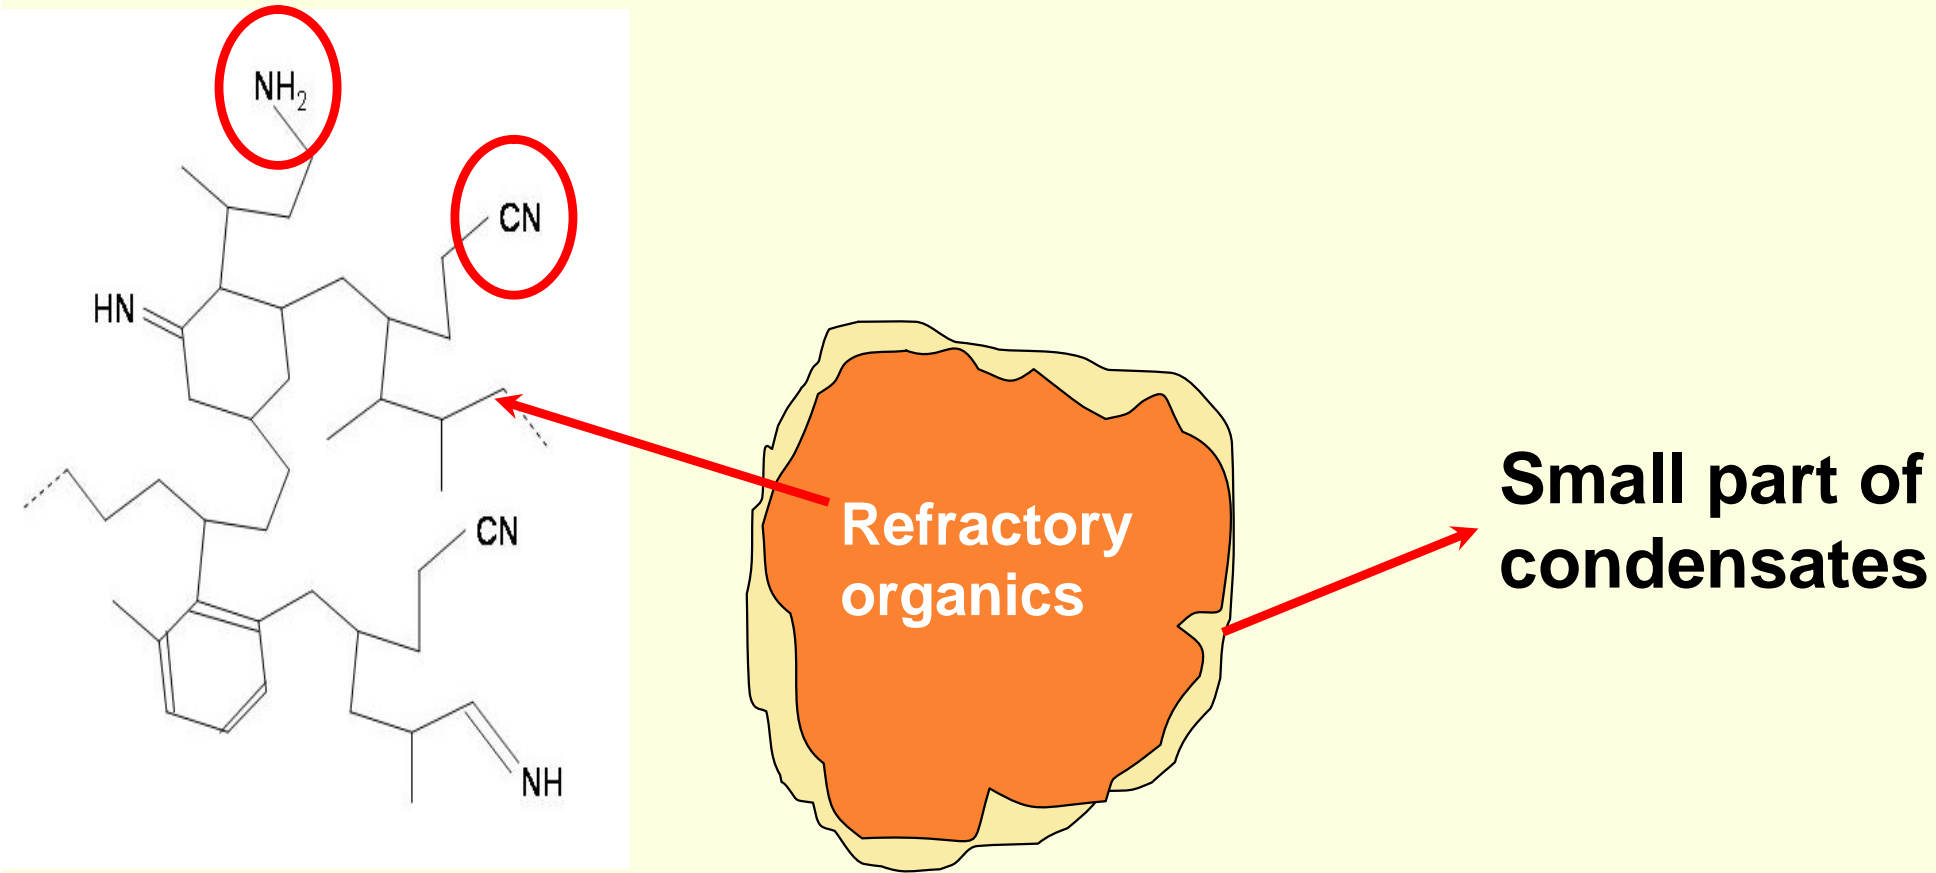

altitude region 1100 - 1300 km

# **Huygens-ACP/GC-MS first data : chemical composition of the aerosols**

- **Aerosols are composed of :**
  - **an organic refractory part,**
  - **made of carbon, hydrogen and nitrogen atoms.**
  
- **Their pyrolysis at 600°C produces HCN and NH<sub>3</sub>: fingerprints of the chemical structure of the aerosol organic solid core.**

- Core molecular structure may include:
- -CN, -NH<sub>2</sub>, -NH- and -N< and /or -C=N-

- => important photochemical sink for atmospheric N and C
- => end-product of a complex organic chemistry
- => supports the tholins model

# SOLID PHASE : THOLINS

- Optical properties: refractive indices
- C/H (0.6 – 1.1) & C/N (~0.7 – ~3)
- IR and UV spectra + pyrolysis-GC-MS
  - aliphatic & benzenic groups
  - CN & NC groups
  - NH<sub>2</sub> & C=NH groups
- Morphology

Low T tholins, Coll *et al.*, ASR, 2001

- **Organic macromolecular material** of largely irregular structure
- **Gel filtration chromatography** of the water soluble fraction :
  - => **molecular mass of ~ 500 to 1000 Daltons**
- **Direct analysis by chemical derivatization techniques** before and after hydrolysis:
  - => **amino-acid or their precursors**
- **And even :**
  - => **nutritious properties** (for terrestrial bacteria ...)
- **No noticeable isotopic C fractionation** from starting methane

- **Complex organic chemistry in the atmosphere – and mainly in the aerosols**
- **Presence of organics playing a key role in terrestrial prebiotic chemistry (HCN, HC<sub>3</sub>N, .... and their oligomers)**

### **3. Life on Titan ?**

**Possible presence of a H<sub>2</sub>O-NH<sub>3</sub> internal ocean**

**chondritic matter => prebiotic compounds**

***An efficient prebiotic reactor:***

- **Low temperature** reduces the rate constants of chemical reactions, but may increase the concentration of species by **eutectic effect** => increases the rate of the reaction
- **High pressure** conditions may induce chemical condensation reactions
- **Hydrothermal vents**, if present, can increase chemical complexity

# Life in Titan's ocean ?

**Fortes (Icarus, 2000) no insurmountable obstacle in this environment:**

- **possible temperature:** ~ 260 + possible occurrence of cryovolvanic hotspots at ~ 300 K
- **pressure:** ~ 5 kbar at depth of 200 km  
=> not incompatible with life
- **pH:** 15 % wt  $\text{NH}_3$  => pH ~11.5  
Some bacteria can grow on Earth at pH 12
- **energy:** \*with radiogenic heat flow ~  $5 \times 10^{11}$  W  
\* biomass density could be 1g /m<sup>2</sup> (not so low....)

What kind of life? Prokaryotic and anaerobic?

Terrestrial archaeobacteria good examples of what can be expected

Methanogenic archaeobacteria:

heterotrophic: organics + H<sub>2</sub> → CH<sub>4</sub> + *organic products*

autotrophic: CO<sub>2</sub> + H<sub>2</sub> or Fe<sup>0</sup> ⇒ CH<sub>4</sub> + *organic products*

\* *organic products* = methanol, methylamine, formate, ..

\* with a <sup>12</sup>C enrichment : ⇒ <sup>12</sup>C/<sup>13</sup>C ~ 91 – 94

*(reference ~89)*

In Titan low atmosphere:

\* GCMS data ⇒ <sup>12</sup>C/<sup>13</sup>C = 82

\* suggests a non biological origin for CH<sub>4</sub>

# **(PRELIMINARY) CONCLUSION & PROSPECTIVE**

## **Origin and cycle of CH<sub>4</sub> : a key question**

- **Illustrates the whole complexity of the Titan's system**
- **CH<sub>4</sub> sources ? Clathrates ? Serpentinisation ? ..**  
**=> Mars and ... Earth inputs ....**
- **CH<sub>4</sub> reservoir replenishing the atmosphere since the beginning ? Episodically ?**  
**=> a sub surface CH<sub>4</sub> reservoir ?**
- **The main product of CH<sub>4</sub> photolysis is C<sub>2</sub>H<sub>6</sub>: should form (surface ?) liquid reservoirs, not yet detected**
- **Complexity of the organic chemistry ?**

**LISA - P. Coll, E. Hebrard, M.-J. Nguyen, R. Sternberg**

**LPG - J.-M. Bernard, E. Quirico, B. Schmitt**

**NASA-GSFC - H. Niemann**

**With my  
astrobiological thanks  
For your attention**

The background of the slide is a photograph of a coastal landscape. In the foreground, a winding river or stream flows through a sandy or light-colored terrain. In the middle ground, there are rolling hills or mountains. The sky is a bright, warm orange, suggesting a sunset or sunrise. The overall color palette is dominated by warm, golden tones.
