

POLAR

**A novel instrument to measure the
linear polarization of the gamma-ray
bursts prompt emission**

Estela Suarez (University of Geneva)
On behalf of the POLAR collaboration

Blois 2008, 21 May 2008

INDEX

- ▶ Gamma Ray Bursts (GRB)
- ▶ POLAR
 - Concept
 - Present status
 - Monte Carlo simulations
 - Laboratory results
- ▶ Summary

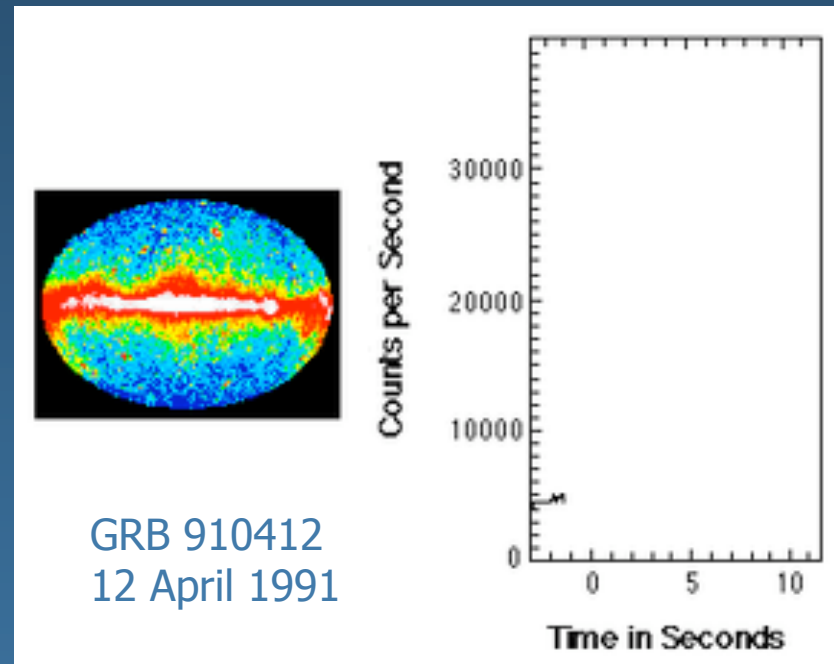

GAMMA RAY BURSTS (GRB)

- ▶ GRBs are flashes of gamma rays, at random places in the sky and at random times.
- ▶ Currently about 2 to 3 GRB are detected per week

- ▶ They are the brightest events in the universe.

- ▶ Nature of their progenitor is unknown.

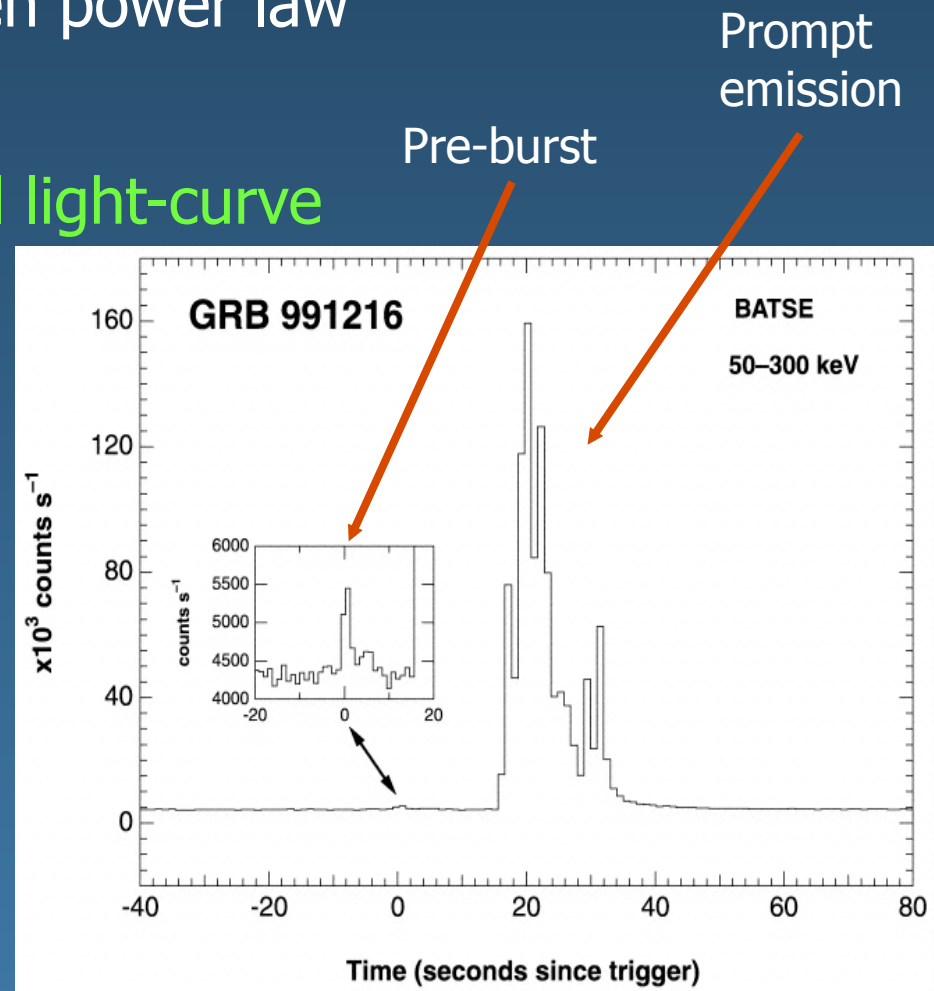

GAMMA RAY BURSTS (GRB)

- ▶ Spectrum: similar to a broken power law

Typical light-curve

- ▶ Light-curves, although very different from GRB to GRB, show three parts:

- Pre-burst
- ▶ Prompt emission
- Afterglow

ORIGIN OF GRB

POLARIZATION IN GRB

► Polarization can be produced by:

- Synchrotron radiation
- Cyclotron Emission
- Bremsstrahlung
- Compton Scattering
- Magnetic photon splitting

► The three most accepted models of GRBs predict different levels of linear polarization:

- Fireball Model: $P_{\text{lin}} \sim 10\text{-}20\%$
- Cannonball Model: $P_{\text{lin}} = 0 - 100\%$
- Electromagnetic Model: $P_{\text{lin}} \sim 50\%$

Polarization can indicate which model is the correct one

HIGH ENERGY POLARIMETRY

- ▶ Measured using Compton Scattering:
 - photons tend to scatter at right angles respect to the initial polarization vector:
 - η - Azimuthal Scatter Angle !
 - θ - Compton Scatter Angle

Klein - Nishina

$$d\sigma = \frac{r_0^2}{2} d\Omega \left(\frac{E'}{E_0} \right)^2 \left(\frac{E_0}{E'} + \frac{E'}{E_0} - 2 \sin^2 \theta \cos^2 \eta \right)$$

- ▶ Distribution in azimuth scattering angles:
 - Modulation curve
- ▶ Level of polarization

$$P = \frac{\mu_p}{\mu_{100}} = \frac{1}{\mu_{100}} \left(\frac{C_{\max} - C_{\min}}{C_{\max} + C_{\min}} \right)$$

from M. McConnell, 2002

POLAR

REQUIREMENTS

- ▶ Compton polarimeter
- ▶ Simple, compact instrument:
 - Relies on given burst position and spectrum
- ▶ Dedicated for GRB observations only:
 - Large effective area
 - Large modulation factor
 - Large field of view
- ▶ Energy range for incoming photons:
 - 50keV – 500keV

DESIGN

- ▶ 40x40 **uniform** scintillator array
 - Light, fast, and low-Z plastic
 - Scintillator size: 6x6x200mm³
 - Matching novel MAPM H8500

- $A_{\text{eff}} \approx 400 \text{ cm}^2$
- $\mu_{100} \approx 35\%$
- FoV $\approx \frac{1}{3}$ of the sky

MC SIMULATIONS

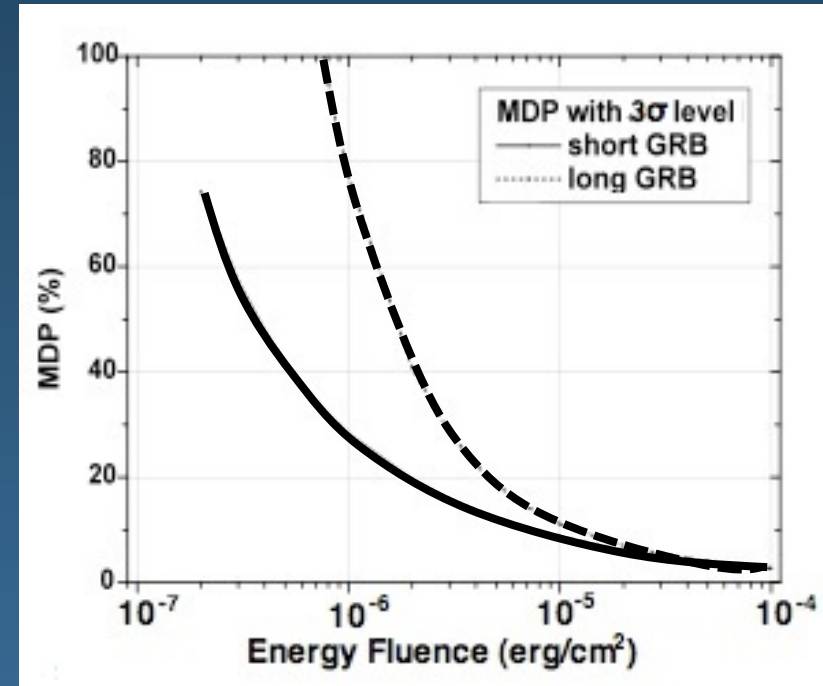

- ▶ GEANT4 package (CERN)
- ▶ Size 240x240x200 mm³
- ▶ 6x6x200mm³ single plastic bars, wrapped with aluminum foil
- ▶ Aluminum wall 1mm thick
- ▶ Photon directions and polarization defined by user
- ▶ Any given energy spectrum
- ▶ Software analysis in ROOT

SOME RESULTS FROM SIMULATIONS

- ▶ Compton effect dominates
- ▶ Most photons deposit energy in several bars
- ▶ Trigger activation: at least 2 channels
- ▶ Selection of two highest E depositions
- ▶ Reacting pixels define geometry
- ▶ MC predicts clear modulation signal

- ▶ Minimum Detectable Polarization:
 $E=10^{-5} \text{ erg/cm}^2 \rightarrow \text{MDP}_{3\sigma} \approx 10\%$
Several measurements per year!

LIGHT COLLECTION STUDIES

► Simulations predict:

1. Around 45% of the optical photons reach PM
2. Differences for incoming gammas at top or bottom: 10-20 %
3. Polishing of the scintillator surface is very important

- ## ► Experimental measurements are finished for 2 and 3 and they agree with the simulations.

LABORATORY RESULTS

LIGHT COLLECTION

- ▶ Goal: optimize light output linearity
- ▶ Sources: ^{241}Am , ^{137}Cs , ^{90}Sr
- ▶ Wrapping: No coating, Al, Teflon, 3M[®] Foil

- ▶ Results:
 - Amplitude changes between bar ends less than 10%-15%
 - 3M[®] wrapping clearly makes light output highest and should be used

- ▶ Results are consistent with MC simulations

ASYMMETRY TESTS with 15 BARS

- ▶ Tests with 60% polarized photons from radioactive source (Cs^{137} , 290 keV)
- ▶ Scintillator bars on MAPMT

$$\text{Asymmetry} = \frac{N_{90} - N_0}{N_{90} + N_0}$$

- ▶ Asymmetry up to 12% depending on distance between plastics; draft data

DEMO-MODEL TESTS

- ▶ DEMO = 2 out of 25 modules:
 - 2 x 64 BC400 bars (6x6x200 mm³ each)
 - 2 x H8500 MAPM
- ▶ Readout: specially designed electronic board
- ▶ Tests:
 - Polarized γ -rays from Cs¹³⁷
 - 100% polarized γ -rays from synchrotron (SLS @ PSI)

DEMO-MODEL SETUP

- ▶ Radioactive source setup:

- ▶ Synchrotron (SLS):

SUMMARY

- ▶ POLAR – Compton hard X-ray GRB polarimeter using low Z scintillators and MAPMT
- ▶ Compact 40x40 homogeneous array of 6x6x200 mm³ plastics
- ▶ $MDP_{3\sigma} \approx 10\%$ for GRB total energy of 10^{-5} erg/cm²; tens of detections/year
- ▶ First asymmetry results obtained demonstrating polarimetric capability. Demo-model measurements being performed at present.
- ▶ Engineering-Qualification Model will be ready in 2010.
- ▶ Accurate measurements of GRB polarization will:
 - Constrain theoretical models
 - Give crucial information for determining the nature of GRB central engine

POLAR COLLABORATION

1. Centre de Physique des Particules de Marseille (CPPM, France)

- Ch. Tao

2. Département de physique Nucléaire et Corpusculaire (DPNC, Switzerland)

- C. Leluc, S. Orsi, M. Pohl, D. Rapin, E. Suarez-Garcia⁴

3. Institute of High Energy Physics (IHEP, China)

- B. Wu, S. Xiang, S.N. Zhang

4. INTEGRAL Science Data Centre (ISDC, Switzerland)

- T.J.-L. Courvoisier, D. Haas², N. Produit, R. Walter

5. Laboratoire d'Annecy de Physique des Particules (LAPP, France)

- G. Lamanna, J.-P. Vialle

6. Paul Scherrer Institut (PSI, Switzerland),

- W. Hajdas, A. Mtchedlishvili

7. The Andrzej Soltan Institute for Nuclear Studies (IPJ, Poland)

- M. Gierlik, R. Marcinkowski, G. Wrochna

Thank you

LAUNCHING POSSIBILITIES

- ▶ Chinese Space Lab, ~2012
- ▶ International Space Station (ISS)
