

# INSTRUCTIONS FOR PRODUCING A CAMERA-READY MANUSCRIPT

A.B. AUTHOR

*Department of Physics, Theoretical Physics, 1 Keble Road,  
Oxford OX1 3NP, England*

This is where the abstract should be placed. It should consist of one paragraph and give a concise summary of the material in the article below. Replace the title, authors, and addresses within the curly brackets with your own title, authors, and addresses; please use capital letters for the title and the authors. You may have as many authors and addresses as you wish. It's preferable not to use footnotes in the abstract or the title; the acknowledgments for funding bodies etc. are placed in a separate section at the end of the text.

## 1 Guidelines

The Blois proceedings are printed from camera-ready manuscripts. The following guidelines are intended to get a uniform rendering of the proceedings. Authors with no connection to Latex should use this sample text as a guide for their presentation using their favorite text editor (see section 1.8)

### 1.1 Producing the Printable Copy

The proceedings paper may be produced using the procedure given below. You should use two files: <sup>a</sup>

*blois.sty* — the style file that provides the higher level latex commands for the proceedings. Don't change these parameters.

*blois.tex* — the main text. You can delete our sample text and replace it with your own contribution to the volume, however we recommend keeping an initial version of the file for reference. Strip off any mail headers and then latex the tex file. The command for latexing is latex blois, do this twice to sort out the cross-referencing.

These files will work with standard Latex 2.09 and Latex2e. If there is an abbreviation defined in the new definitions at the top of the file *blois.tex* that conflicts with one of your own macros, then delete the appropriate command and revert to longhand. Failing that, please consult your local texpert to check for other conflicting macros that may be unique to your computer system. **Page numbers should not appear.**

### 1.2 Headings and Text and Equations

Please preserve the style of the headings, text fonts and line spacing to provide a uniform style for the proceedings volume.

---

<sup>a</sup>You can get these files from our WWW pages at <http://blois.in2p3.fr/2012/proceedings.html>.

Table 1: Experimental Data bearing on  $\Gamma(K \rightarrow \pi\pi\gamma)$  for the  $K_S^0, K_L^0$  and  $K^-$  mesons.

	$\Gamma(\pi^-\pi^0) s^{-1}$	$\Gamma(\pi^-\pi^0\gamma) s^{-1}$	
	Process for Decay		
$K^-$	$1.711 \times 10^7$	$2.22 \times 10^4$ (DE $1.46 \times 10^3$ )	No (IB)-E1 interference seen but data shows excess events relative to IB over $E_\gamma^* = 80$ to $100 MeV$

Equations should be centered and numbered consecutively, as in Eq. 1, and the *eqnarray* environment may be used to split equations into several lines, for example in Eq. 3, or to align several equations. An alternative method is given in Eq. 2 for long sets of equations where only one referencing equation number is wanted.

In latex, it is simplest to give the equation a label, as in Eq. 1 where we have used `\label{eq:murnf}` to identify the equation. You can then use the reference `\ref{eq:murnf}` when citing the equation in the text which will avoid the need to manually renumber equations due to later changes. (Look at the source file for some examples of this.)

The same method can be used for referring to sections and subsections.

### 1.3 Tables

The tables are designed to have a uniform style throughout the proceedings volume. It doesn't matter how you choose to place the inner lines of the table, but we would prefer the border lines to be of the style shown in Table 1. The top and bottom horizontal lines should be single (using `\hline`), and there should be single vertical lines on the perimeter, (using `\begin{tabular}{...}`). For the inner lines of the table, it looks better if they are kept to a minimum. We've chosen a more complicated example purely as an illustration of what is possible.

The caption heading for a table should be placed at the top of the table.

### 1.4 Figures

If you wish to 'embed' a postscript figure in the file, then remove the % mark from the declaration of the postscript figure within the figure description and change the filename to an appropriate one. Also remove the comment mark from the *input epsfig* command at the top of the file. You may need to play around with this as different computer systems appear to use different commands.

Next adjust the scaling of the figure until it's correctly positioned, and remove the declarations of the lines and any anomalous spacing.

If you prefer to use some other method then it's very important to leave the correct amount of vertical space in the figure declaration to accomodate your figure (remove the lines and change the *vspace* in the example.)

The caption heading for a figure should be placed below the figure.

### 1.5 Limitations on the Placement of Tables, Equations and Figures

Very large figures and tables should be placed on a page by themselves. One can use the instruction `\begin{figure}[p]` or `\begin{table}[p]` to position these, and they will appear on a separate

page devoted to figures and tables. We would recommend making any necessary adjustments to the layout of the figures and tables only in the final draft. It is also simplest to sort out line and page breaks in the last stages.

### 1.6 Acknowledgments, Appendices, Footnotes and the Bibliography

If you wish to have acknowledgments to funding bodies etc., these may be placed in a separate section at the end of the text, before the Appendices. This should not be numbered so use `\section*{Acknowledgments}`.

It's preferable to have no appendices in a brief article, but if more than one is necessary then simply copy the `\section*{Appendix}` heading and type in Appendix A, Appendix B etc. between the brackets.

Footnotes are denoted by a letter superscript in the text,<sup>b</sup> and references are denoted by a number superscript. We have used `\bibitem` to produce the bibliography. Citations in the text use the labels defined in the `\bibitem` declaration, for example, the first paper by Jarlskog<sup>1</sup> is cited using the command `\cite{ja}`.

If you more commonly use the method of square brackets in the line of text for citation than the superscript method, please note that you need to adjust the punctuation so that the citation command appears after the punctuation mark.

### 1.7 Photograph

You may want to include a photograph of yourself below the title of your talk. A scanned photo can be directly included by uncommenting (delete the % sign at the beginning of the lines) the following paragraph in **blois.sty**:

```
%\begin{figure}[h]
%\begin{center}
%\psfig{figure=mypicture.ps,height=35mm}
%\end{center}
%\end{figure}
```

### 1.8 Final Manuscript

All files (.tex .eps and .pdf or .ps) should be sent by the **15th of September 2012** by e-mail to **jacques.dumarchez@cern.ch**.

## 2 Sample Text

The following may be (and has been) described as ‘dangerously irrelevant’ physics. The Lorentz-invariant phase space integral for a general n-body decay from a particle with momentum  $P$  and mass  $M$  is given by:

$$I((P - k_i)^2, m_i^2, M) = \frac{1}{(2\pi)^5} \int \frac{d^3 k_i}{2\omega_i} \delta^4(P - k_i). \quad (1)$$

The only experiment on  $K^\pm \rightarrow \pi^\pm \pi^0 \gamma$  since 1976 is that of Bolotov *et al.*<sup>3</sup> There are two necessary conditions required for any acceptable parametrization of the quark mixing matrix.

---

<sup>b</sup>Just like this one.

---

---

Figure 1: Radiative (off-shell, off-page and out-to-lunch) SUSY Higglets.

The first is that the matrix must be unitary, and the second is that it should contain a CP violating phase  $\delta$ . In Sec. 1.4 the connection between invariants (of form similar to J) and unitarity relations will be examined further for the more general  $n \times n$  case. The reason is that such a matrix is not a faithful representation of the group, i.e. it does not cover all of the parameter space available.

$$\begin{aligned}
\mathbf{K} &= Im[V_{j,\alpha} V_{j,\alpha+1}^* V_{j+1,\alpha} V_{j+1,\alpha+1}^*] \\
&\quad + Im[V_{k,\alpha+2} V_{k,\alpha+3}^* V_{k+1,\alpha+2} V_{k+1,\alpha+3}^*] \\
&\quad + Im[V_{j+2,\beta} V_{j+2,\beta+1}^* V_{j+3,\beta} V_{j+3,\beta+1}^*] \\
&\quad + Im[V_{k+2,\beta+2} V_{k+2,\beta+3}^* V_{k+3,\beta+2} V_{k+3,\beta+3}^*] \\
\mathbf{M} &= Im[V_{j,\alpha} V_{j,\alpha+1} V_{j+1,\alpha} V_{j+1,\alpha+1}^*] \\
&\quad + Im[V_{k,\alpha+2} V_{k,\alpha+3}^* V_{k+1,\alpha+2} V_{k+1,\alpha+3}^*] \\
&\quad + Im[V_{j+2,\beta} V_{j+2,\beta+1} V_{j+3,\beta} V_{j+3,\beta+1}^*] \\
&\quad + Im[V_{k+2,\beta+2} V_{k+2,\beta+3}^* V_{k+3,\beta+2} V_{k+3,\beta+3}^*],
\end{aligned} \tag{2}$$

where  $k = j$  or  $j + 1$  and  $\beta = \alpha$  or  $\alpha + 1$ , but if  $k = j + 1$ , then  $\beta \neq \alpha + 1$  and similarly, if  $\beta = \alpha + 1$  then  $k \neq j + 1$ .<sup>c</sup> There are only 162 quark mixing matrices using these parameters which are to first order in the phase variable  $e^{i\delta}$  as is the case for the Jarlskog parametrizations, and for which J is not identically zero. It should be noted that these are physically identical and form just one true parametrization.

$$\begin{aligned}
T &= Im[V_{11} V_{12} V_{21}^* V_{22}] \\
&\quad + Im[V_{12} V_{13} V_{22}^* V_{23}] \\
&\quad - Im[V_{33} V_{31} V_{13}^* V_{11}].
\end{aligned} \tag{3}$$

## Acknowledgments

This is where one places acknowledgments for funding bodies etc. Note that there are no section numbers for the Acknowledgments, Appendix or References.

## Appendix

We can insert an appendix here and place equations so that they are given numbers such as Eq. 4.

$$x = y. \tag{4}$$

---

<sup>c</sup>An example of a matrix which has elements containing the phase variable  $e^{i\delta}$  to second order, i.e. elements with a phase variable  $e^{2i\delta}$  is given at the end of this section.
