

Z' production at the LHC in an extended MSSM

GENNARO CORCELLA

INFN, Laboratori Nazionali di Frascati

1. Introduction
2. Z' production in $U(1)'$ and Sequential Standard Model
3. MSSM features including $U(1)'$
4. Z' branching ratios in SM and MSSM
5. Cross sections and event rates at the LHC
6. Conclusions

G.C. and S. Gentile, arXiv:1205.5780 [hep-ph].

Searches for heavy gauge bosons Z' among the main objectives of LHC

String-inspired $U(1)'$, Kaluza–Klein gravitons, Sequential Standard Model (SM-like couplings)

LHC analyses focus on SM decays, e.g. high-mass dilepton resonances

CMS: $\mathcal{L} = 4.9 \text{ fb}^{-1}$ (dileptons)

$$m(Z'_{SSM}) > 2.32 \text{ TeV}, m(Z'_{\psi}) > 2.00 \text{ TeV}, m(Z'_{KK}) > 1.81 - 2.13 \text{ TeV}$$

ATLAS: $\mathcal{L} = 1.08 \text{ fb}^{-1}$ (e^+e^-) and $\mathcal{L} = 1.21 \text{ fb}^{-1}$ ($\mu^+\mu^-$)

$$m(Z'_{SSM}) > 1.83 \text{ TeV}, m(Z'_{U(1)'}) > 1.49-1.64 \text{ TeV}, m(Z'_{KK}) > 0.71-1.63 \text{ TeV}$$

In BSM analyses, why not BSM Z' decays, e.g. both SM and MSSM modes
 Z' mass constrains invariant masses; unexplored corners of phase space

Lower SM branching ratios with BSM decays \Rightarrow lower Z' mass exclusion limits

T. Gherghetta et al., PRD57 (1998) 3178: pioneering work on Z' decays in the MSSM, but for $m_{Z'} = 700 \text{ GeV}$ and only one point in the parameter space

C.-F. Chang et al., JHEP09 (2011) 058: two sets of MSSM parameters and $m_{Z'} = 1-2 \text{ TeV}$, but treating sfermion, gaugino and Higgs masses as free parameters

U(1)' gauge groups in GUT-inspired models:

$$E_6 \rightarrow SO(10) \times U(1)_\psi \quad , \quad SO(10) \rightarrow SU(5) \times U(1)_\chi$$

$$Z'(\theta) = Z'_\psi \cos \theta - Z'_\chi \sin \theta$$

$$E_6 \rightarrow SM \times U(1)_\eta \quad \theta = \arccos \sqrt{5/8} \Rightarrow Z'_\eta$$

Orthogonal combination to Z'_η : $\theta = \arccos \sqrt{5/8} - \pi/2 \Rightarrow Z'_I$

Secluded model (singlet S): $\theta = \arctan(\sqrt{15}/9) - \pi/2 \Rightarrow Z'_S$

Representations of E_6 , $SO(10)$ and $SU(5)$:

$$E_6 \quad : \quad \mathbf{27} = (Q, u^c, e^c, L, d^c, \nu^c, H, D^c, H^c, D, S^c)_L$$

$$SU(5) \quad : \quad \mathbf{10} = (Q, u^c, e^c), \bar{\mathbf{5}} = (L, d^c), \mathbf{1} = (\nu^c), \bar{\mathbf{5}} = (H, D^c), \mathbf{5} = (H^c, D), \mathbf{1} = (S^c)$$

”Conventional” $SO(10)$: $\mathbf{16} = (Q, u^c, e^c, L, d^c, \nu^c)$, $\mathbf{10} = (H, D^c, H^c, D)$, $\mathbf{1} = (S^c)$

”Unconventional” $SO(10)$: $\mathbf{16} = (Q, u^c, e^c, H, D^c, \nu^c)$, $\mathbf{10} = (L, d^c, H^c, D)$, $\mathbf{1} = (S^c)$

From conventional to unconventional $SO(10)$ representations: $\theta \rightarrow \theta' - \arctan \sqrt{15}$

U(1)' coupling and charges in the conventional assignments:

Model	θ
Z'_χ	$-\pi/2$
Z'_ψ	0
Z'_η	$\arccos \sqrt{5/8}$
Z'_I	$\arccos \sqrt{5/8} - \pi/2$
Z'_N	$\arctan \sqrt{15} - \pi/2$
Z'_S	$\arctan(\sqrt{15}/9) - \pi/2$

	$2\sqrt{10} Q_\chi$	$2\sqrt{6} Q_\psi$	$2\sqrt{15} Q_\eta$
Q	-1	1	2
u^c	-1	1	2
d^c	3	1	-1
L	3	1	-1
e^c	-1	1	2
ν_e^c	-5	1	5
H	-2	-2	-1
H^c	2	-2	-4
S^c	0	4	5
D	2	-2	-4
D^c	-2	-2	-1

$$g' = \sqrt{\frac{5}{3}} g_1 \quad ; \quad Q'(\Phi) = Q'_\psi(\Phi) \cos \theta - Q'_\chi(\Phi) \sin \theta$$

$Q = (u \ d)_L$, $L = (e \ \nu_e)_L$, D : (s)quarks H : (s)leptons, S : singlet

Assumption: D and H are exotic quarks and leptons much heavier than the Z'

Minimal Supersymmetric Standard Model and U(1)'

The extra Z' requires a singlet Higgs to break U(1)' and get mass

Higgs sector: h, H, A, H^\pm (MSSM) and a new scalar H'

Three vacuum expectation values $v_1 < v_2 < v_3$ $\tan \beta = v_2/v_1$

Gauginos: new \tilde{Z}' and \tilde{H}' lead to two new neutralinos, i.e. $\tilde{\chi}_1^0, \dots, \tilde{\chi}_6^0$

Chargino sector is unchanged, as the Z' is neutral

New Z' decay modes besides the SM ones:

$$Z' \rightarrow \tilde{q}\tilde{q}^*, \tilde{\ell}^+\tilde{\ell}^-, \tilde{\nu}\tilde{\nu}^*, \tilde{\chi}_i^0\tilde{\chi}_j^0, \tilde{\chi}_{1,2}^+\tilde{\chi}_{1,2}^-, ZH, Zh, ZA, H^+H^-, hA, HA, WW$$

Tree-level gaugino masses are obtained after diagonalizing the mass matrices in terms of the MSSM parameters $M_1, M_2, M', \tan \beta, A_f, \mu$

Examples for pseudoscalar and charged Higgs and chargino masses:

$$m_{H^\pm}^2 = \frac{2\sqrt{2}\mu A_f}{\sin 2\beta} + \left(1 - 4\frac{\mu^2}{g_2^2 v_3^2}\right) m_W^2, \quad m_A^2 = \frac{\sqrt{2}\mu A_f v_3}{\sin 2\beta} \left(1 + \frac{v_1^2 + v_2^2}{4v_3^2} \sin^2 2\beta\right)$$

$$m_{\tilde{\chi}_{1,2}^\pm}^2 = \frac{1}{2} \left[|M_2|^2 + |\mu|^2 + 2m_W^2 \mp \sqrt{(|M_2|^2 + |\mu|^2 + 2m_W^2)^2 - 4|\mu M_2 - m_W^2 \sin 2\beta|^2} \right]$$

Sfermion masses m_a^2 get D-terms like (m_0 soft mass at the Z' scale):

$$V(\phi, \phi^*) \sim \frac{1}{2} \sum_a g_a^2 (\phi^* T^a \phi)^2 \quad ; \quad m^2 = m_0^2 + \Delta m_D^2$$

First contribution (electroweak symmetry breaking):

$$\Delta \tilde{m}_a^2 = (T_{3,a} g_1^2 - Y_a g_2^2) (v_1^2 - v_2^2) = (T_{3,a} - Q_a \sin^2 \theta_W) m_Z^2 \cos 2\beta$$

Second contribution driven by the new $U(1)'$ symmetry:

$$\Delta \tilde{m}'_a{}^2 = \frac{g'^2}{2} (Q'_1 v_1^2 + Q'_2 v_2^2 + Q'_3 v_3^2)$$

$$\mathcal{M}_{\tilde{f}}^2 = \begin{pmatrix} (M_{\tilde{L}\tilde{L}}^{\tilde{f}})^2 & (M_{\tilde{L}\tilde{R}}^{\tilde{f}})^2 \\ (M_{\tilde{L}\tilde{R}}^{\tilde{f}})^2 & (M_{\tilde{R}\tilde{R}}^{\tilde{f}})^2 \end{pmatrix}$$

$$(M_{\tilde{L}\tilde{L}}^{\tilde{u}})^2 = (m_{\tilde{u}_L}^0)^2 + m_u^2 + \left(\frac{1}{2} - \frac{2}{3} x_w \right) m_Z^2 \cos 2\beta + Q'_{\tilde{u}_L} \Delta \tilde{m}'_{\tilde{u}_L}{}^2$$

$$(M_{\tilde{R}\tilde{R}}^{\tilde{u}})^2 = (m_{\tilde{u}_R}^0)^2 + m_u^2 + \left(\frac{1}{2} - \frac{2}{3} x_w \right) m_Z^2 \cos 2\beta + Q'_{\tilde{u}_R} \Delta \tilde{m}'_{\tilde{u}_R}{}^2$$

$$(M_{\tilde{L}\tilde{R}}^{\tilde{u}})^2 = m_u (A_u - \mu \cot \beta) .$$

Mass eigenstates $\tilde{u}_{1,2}, \tilde{d}_{1,2}, \tilde{\ell}_{1,2}, \tilde{\nu}_{1,2}$ – mixing term relevant only for stop quarks

Z' decays into final states with leptons

Branching ratios into SM and BSM particles varying the Z' and slepton masses

$\mu = 200$, $\tan \beta = 20$, $A_q = A_\ell = 500$ GeV , $m_{\tilde{q}}^0 = 5$ TeV , $M_1 = 150$ GeV , $M_2 = 300$ GeV , $M' = 1$ TeV

Dependence of branching ratios on Z' and slepton masses

Production cross sections in pp collisions $q\bar{q} \rightarrow Z'$, LO pdf CTEQ6L

Expected event numbers (narrow width approximation):

$$\sigma(pp \rightarrow Z' \rightarrow f_1 f_2) \simeq \sigma(pp \rightarrow Z') \times \text{BR}(Z' \rightarrow f_1 f_2) ; N = \mathcal{L}\sigma$$

Cascade events: $N_{\text{casc}} = N(\tilde{\nu}\tilde{\nu}^*) + N(\tilde{\chi}^+\tilde{\chi}^-) + N(\tilde{\chi}^0\tilde{\chi}^0)$

Charged-slepton events: $N_{\text{slep}} = N(\tilde{\ell}^+\tilde{\ell}^-)$

$$\sqrt{s} = 8 \text{ TeV} \quad \mathcal{L} = 20 \text{ fb}^{-1}$$

$$\sqrt{s} = 14 \text{ TeV} \quad \mathcal{L} = 100 \text{ fb}^{-1}$$

Conclusions and outlook

Novel investigation on Z' phenomenology in supersymmetry at the LHC

BSM modes decrease the SM rates and the Z' may set a constrain on sparticle invariant masses

Marrying $U(1)'$ and MSSM: two extra neutralinos, one new neutral scalar Higgs, D-term contribution to sfermion masses

Studies of mass spectra, Z' branching ratios and production cross sections spanning the parameter space

BSM branching ratios 10-30% for $U(1)'$ groups and up to 60% for SSM

Up to $\mathcal{O}(10^5)$ supersymmetric events with sleptons and gauginos in the high-luminosity phase of the LHC, especially for SSM

In progress:

Implementation of the $U(1)'/\text{MSSM}$ models in HERWIG: parton showers, Z' width effects, hadronization and acceptance cuts on jets and leptons

Investigations of 'unconventional' E_6 scenarios

Revisiting the limits on the Z' mass

Representative Point:

$$m_{Z'} = 3 \text{ TeV}, \quad \theta = \theta_I = \arccos \sqrt{\frac{5}{8}} - \frac{\pi}{2}$$

$$\mu = 200, \quad \tan \beta = 20, \quad A_q = A_\ell = A_f = 500 \text{ GeV}$$

$$m_{\tilde{q}_L}^0 = m_{\tilde{q}_R}^0 = m_{\tilde{\ell}_L}^0 = m_{\tilde{\ell}_R}^0 = m_{\tilde{\nu}_L}^0 = m_{\tilde{\nu}_R}^0 = 2.5 \text{ TeV}$$

$$M_1 = 100 \text{ GeV}, \quad M_2 = 200 \text{ GeV}, \quad M' = 1 \text{ TeV}$$
