

Two Higgs doublet model with $U(1)_H$ Higgs symmetry and dark matter

Chaehyun Yu

Collaboration with P. Ko (KIAS) and Yuji Omura (Nagoya U.)

Based on JHEP 1401, 016; arXiv:1405.2138

26th Rencontres de Blois
May 21, 2014

Two Higgs doublet model

- Many high-energy models predict extra Higgs doublets.
 - SUSY, GUT, flavor symmetric models, etc.
- Two Higgs doublet model could be an effective theory of a high-energy theory.
- Two (or multi) Higgs doublet model itself is interesting.
 - Higgs physics (heavy Higgs, pseudoscalar, charged Higgs physics)
 - **dark matter physics** (one of Higgs scalar or extra fermions could be CDM.)
Ma,PRD73;Barbieri,Hall,Rychkov,PRD74
 - baryon asymmetry of the Universe Shu,Zhang,PRL111
 - neutrino mass generation Kanemura,Matsui,Sugiyama,PLB727
 - can resolve experimental anomalies (top A_{FB} at Tevatron, $B \rightarrow D^{(*)}TV$ at BABAR) Ko,Omura,Yu,EPJC73;JHEP1303

2HDM with Z_2 symmetry (2HDMw Z_2)

- One of the simplest models to extend the SM Higgs sector.
- In general, flavor changing neutral currents (FCNCs) appear.
- A simple way to avoid the FCNC problem is to assign **ad hoc Z_2 symmetry**.

Type	H_1	H_2	U_R	D_R	E_R	N_R	$Q_{L,L}$
I	+	-	+	+	+	+	+
II	+	-	+	-	-	+	+
X	+	-	+	+	-	-	+
Y	+	-	+	-	+	-	+

Fermions of same electric charges get their masses from one Higgs VEV.

$$\mathcal{L} = \bar{L}_i (y_{1ij}^E H_1 + \cancel{y_{2ij}^E H_2}) E_{Rj} + \text{H.c.} \quad \text{or vice versa}$$

NO FCNC at tree level.

Generic problems of 2HDM

- It is well known that discrete symmetry could generate a domain wall problem when it is spontaneously broken.
- Usually the Z_2 symmetry is assumed to be broken softly by a dim-2 operator, $H_1^\dagger H_2$ term.

The softly broken Z_2 symmetric 2HDM potential

$$V = m_1^2 H_1^\dagger H_1 + m_2^2 H_2^\dagger H_2 - (m_{12}^2 H_1^\dagger H_2 + h.c.) + \frac{1}{2} \lambda_1 (H_1^\dagger H_1)^2 + \frac{1}{2} \lambda_2 (H_2^\dagger H_2)^2 \\ + \lambda_3 (H_1^\dagger H_1)(H_2^\dagger H_2) + \lambda_4 (H_1^\dagger H_2)(H_2^\dagger H_1) + \frac{1}{2} \lambda_5 [(H_1^\dagger H_2)^2 + h.c.]$$

- the origin of the softly breaking term?

Z_2 symmetry in 2HDM can be replaced by new $U(1)_H$ symmetry associated with Higgs flavors.

Type-I 2HDM

- Only one Higgs couples with fermions.

$$V_y = y_{ij}^U \bar{Q}_{Li} \tilde{H}_1 U_{Rj} + y_{ij}^D \bar{Q}_{Li} H_1 D_{Rj} + y_{ij}^E \bar{L}_i H_1 E_{Rj} + y_{ij}^N \bar{L}_i \tilde{H}_1 N_{Rj}$$

- anomaly free $U(1)_H$ without extra fermions except RH neutrinos.

U_R	D_R	Q_L	L	E_R	N_R	H_1
u	d	$\frac{(u+d)}{2}$	$\frac{-3(u+d)}{2}$	$-(2u+d)$	$-(u+2d)$	$\frac{(u-d)}{2}$

2 parameters

- In general, extra fermions are required in order to cancel gauge anomaly.

→ one of extra fermions can be a candidate for the cold dark matter.

Type-I 2HDM

- Only one Higgs couples with fermions.

$$V_y = y_{ij}^U \bar{Q}_{Li} \tilde{H}_1 U_{Rj} + y_{ij}^D \bar{Q}_{Li} H_1 D_{Rj} + y_{ij}^E \bar{L}_i H_1 E_{Rj} + y_{ij}^N \bar{L}_i \tilde{H}_1 N_{Rj}$$

- anomaly free $U(1)_H$ without no extra fermions except RH neutrinos.

U_R	D_R	Q_R	L	E_R	N_R	H_1	Type
u	d	$\frac{(u+d)}{2}$	$\frac{-3(u+d)}{2}$	$-(2u+d)$	$-(u+2d)$	$\frac{(u-d)}{2}$	
0	0	0	0	0	0	0	$h_2 \neq 0$
1/3	1/3	1/3	-1	-1	-1	0	$U(1)_{B-L}$
1	-1	0	0	-1	1	1	$U(1)_R$
2/3	-1/3	1/6	-1/2	-1	0	1/2	$U(1)_Y$

Ko, Omura, Yu, PLB717,202(2013)

- SM fermions are $U(1)_H$ singlets.
- Z_H is fermiophobic and Higgphilic.

Type-II 2HDM

- H_1 couples to the up-type fermions, while H_2 couples to the down-type fermions.

$$V_y = y_{ij}^U \bar{Q}_{Li} \tilde{H}_1 U_{Rj} + y_{ij}^D \bar{Q}_{Li} H_2 D_{Rj} + y_{ij}^E \bar{L}_i H_2 E_{Rj} + y_{ij}^N \bar{L}_i \tilde{H}_1 N_{Rj}$$

U_R	D_R	Q_L	L	E_R	N_R	H_1	H_2
u	0	0	0	0	u	u	0

- Requires extra chiral fermions for cancellation of gauge anomaly.

	$SU(3)$	$SU(2)$	$U(1)_Y$	$U(1)_H$
q_{Li}	3	1	2/3	$\hat{Q}_L = u + \hat{Q}_R$
q_{Ri}	3	1	2/3	\hat{Q}_R
n_{Li}	1	1	0	$\hat{n}_L = u + \hat{n}_R$
n_{Ri}	1	1	0	\hat{n}_R

Two vector-like pairs of $SU(2)_L$

One of extra fermions can be a candidate for CDM.

Constraints

- experimental and theoretical constraints

$$m_h \sim 126 \text{ GeV}$$

$$|m_{H^+} - m_A|$$

$$|m_{H^+} - m_H|$$

$$\sin(\beta - \alpha)$$

$$\tan \beta$$

$$m_{H^+}$$

$$m_H$$

EWPOs

small mass differences required

Exotic top decay

$$b \rightarrow s\gamma$$

Heavy Higgs search at LHC

Perturbativity

Unitarity

Vacuum stability

$$\tan \beta \gtrsim 1$$

Hermann, Misiak, Steinhauser, JHEP1211 (2012) 036

→ Upper limits on production cross section × branching ratio

Z-Z_H mixing

- tree-level mixing ($v_i \neq 0$)

$$\Delta M_{ZZH}^2 = -\frac{\hat{M}_Z}{v} g_H \sum_{i=1}^2 q_{H_i} v_i^2 \quad \tan 2\xi = \frac{2\Delta M_{ZZH}^2}{\hat{M}_{Z_H}^2 - \hat{M}_Z^2}$$

- loop-level mixing ($v_1=0, v_2 \neq 0$)

$$-\frac{\kappa_Z}{2} F_Z^{\mu\nu} F_{H\mu\nu} - \frac{\kappa_\gamma}{2} F_\gamma^{\mu\nu} F_{H\mu\nu} + \Delta M_{Z_H Z}^2 \hat{Z}^\mu \hat{Z}_{H\mu}$$

$$\kappa_Z = \frac{q_H g_H e c_W}{16\pi^2 s_W} \left\{ \frac{1}{3} \ln \left(\frac{m_A^2}{m_{H^+}^2} \right) - \frac{1}{6} \frac{m_A^2 - m_H^2}{m_A^2} \right\},$$

$$\kappa_\gamma = \frac{q_H g_H e}{16\pi^2} \left\{ \frac{1}{3} \ln \left(\frac{m_A^2}{m_{H^+}^2} \right) - \frac{1}{6} \frac{m_A^2 - m_H^2}{m_A^2} \right\},$$

$$\Delta M_{Z_H Z}^2 = -\frac{q_H g_H e}{32\pi^2 s_W c_W} (m_A^2 - m_H^2).$$

The mixing can appear because of $SU(2)_L \times U(1)_Y$ breaking effects.

- collider bound depends on the $U(1)_H$ charge assignment.
- In the fermiophobic Z_H case, the Z_H boson can be produced through the Z- Z_H mixing and the bound for the mixing angle is

$$\sin \xi \lesssim O(10^{-2}) \sim O(10^{-3})$$

Inert Doublet Model (IDMwZ₂)

- a 2HDM ~ one of the simplest extension
- One of Higgs doublets does not develop VEV and exact Z₂ symmetry is imposed.
- The new Higgs doublet does not participate in the EW symmetry breaking.
- Under the Z₂ symmetry, SM particles are even, but the new Higgs doublet is odd.
- Viable DM candidate

$$H_1 = \begin{pmatrix} H^+ \\ \frac{1}{\sqrt{2}} (\underbrace{H}_{\text{DM candidates}} + i\underbrace{A}_{\text{DM candidates}}) \end{pmatrix}, \quad H_2 = \begin{pmatrix} G^+ \\ \frac{1}{\sqrt{2}} (v + \underbrace{h}_{\text{SM-like Higgs}} + iG^0) \end{pmatrix}$$

Inert Doublet Model (IDMwZ₂)

- CP-conserving potential

$$V = \mu_1 (H_1^\dagger H_1) + \mu_2 (H_2^\dagger H_2) - \mu_{12} (H_1^\dagger H_2 + h.c.) + \frac{\lambda_1}{2} (H_1^\dagger H_1)^2 + \frac{\lambda_2}{2} (H_2^\dagger H_2)^2 + \lambda_3 (H_1^\dagger H_1)(H_2^\dagger H_2) + \lambda_4 |H_1^\dagger H_2|^2 + \frac{\lambda_5}{2} \{ (H_1^\dagger H_2)^2 + h.c. \}.$$

forbidden by the Z₂ symmetry

- Type-I Yukawa interactions ~ only H₂ couples to the SM fermions.
- The h decay to two photons receives additional contribution through charged Higgs loop.

- H, A, H[±] ~ do not couple to SM fermions at tree level.

Inert Double Model (IDMwU(1)_H)

- We replace the Z_2 symmetry by **U(1) gauge symmetry**.
- A SM-singlet Φ has to be added.
- Without Φ , Z_H boson becomes massless.

$$\begin{aligned} V = & (m_1^2 + \tilde{\lambda}_1 |\Phi|^2)(H_1^\dagger H_1) + (m_2^2 + \tilde{\lambda}_2 |\Phi|^2)(H_2^\dagger H_2) - (m_{12}^2 H_1^\dagger H_2 + \text{h.c.}) \\ & + \frac{\lambda_1}{2} (H_1^\dagger H_1)^2 + \frac{\lambda_2}{2} (H_2^\dagger H_2)^2 + \lambda_3 (H_1^\dagger H_1)(H_2^\dagger H_2) + \lambda_4 |H_1^\dagger H_2|^2 \\ & + \frac{\lambda_5}{2} \{(H_1^\dagger H_2)^2 + \text{h.c.}\} + m_\Phi^2 |\Phi|^2 + \lambda_\Phi |\Phi|^4 \end{aligned}$$

- Φ breaks the $U(1)_H$ symmetry while H_2 breaks the EW symmetry.
- The remnant symmetry of $U(1)_H$ is the origin of the exact Z_2 symmetry.

Inert Double Model (IDMwU(1)_H)

- We replace the Z₂ symmetry by **U(1) gauge symmetry**.
- A SM-singlet Φ has to be added.
- Without Φ , Z_H boson becomes massless.

$$\begin{aligned}
 V = & (m_1^2 + \tilde{\lambda}_1 |\Phi|^2)(H_1^\dagger H_1) + (m_2^2 + \tilde{\lambda}_2 |\Phi|^2)(H_2^\dagger H_2) - \cancel{(m_{12}^2 H_1^\dagger H_2 + \text{h.c.})} \\
 & + \frac{\lambda_1}{2} (H_1^\dagger H_1)^2 + \frac{\lambda_2}{2} (H_2^\dagger H_2)^2 + \lambda_3 (H_1^\dagger H_1)(H_2^\dagger H_2) + \lambda_4 |H_1^\dagger H_2|^2 \\
 & + \frac{\lambda_5}{2} \{ \cancel{(H_1^\dagger H_2)^2} + \text{h.c.} \} + m_\Phi^2 |\Phi|^2 + \lambda_\Phi |\Phi|^4
 \end{aligned}$$

forbidden
by the Z₂ symmetry

forbidden by the U(1)_H symmetry (q_{H₂}=0, q_{H₁}≠0)

- Φ breaks the U(1)_H symmetry while H₂ breaks the EW symmetry.
- The remnant symmetry of U(1)_H is the origin of the exact Z₂ symmetry.

Inert Double Model (IDMwU(1)_H)

- IDM + SM-singlet Φ .

$$\begin{aligned}
 V = & (m_1^2 + \tilde{\lambda}_1 |\Phi|^2)(H_1^\dagger H_1) + (m_2^2 + \tilde{\lambda}_2 |\Phi|^2)(H_2^\dagger H_2) - (m_{12}^2 H_1^\dagger H_2 + \text{h.c.}) \\
 & + \frac{\lambda_1}{2} (H_1^\dagger H_1)^2 + \frac{\lambda_2}{2} (H_2^\dagger H_2)^2 + \lambda_3 (H_1^\dagger H_1)(H_2^\dagger H_2) + \lambda_4 |H_1^\dagger H_2|^2 \\
 & + \frac{\lambda_5}{2} \{ (H_1^\dagger H_2)^2 + \text{h.c.} \} + m_\Phi^2 |\Phi|^2 + \lambda_\Phi |\Phi|^4
 \end{aligned}$$

forbidden
by the Z_2 symmetry

forbidden by the $U(1)_H$ symmetry ($q_{H_2}=0, q_{H_1} \neq 0$)

- Without λ_5 , H and A are degenerate.

$$m_A = \sqrt{m_H^2 - \lambda_5 v^2}$$

- Direct searches for DM at XENON100 and LUX exclude this degenerate case.

Inert Double Model (IDMwU(1)_H)

- IDM + SM-singlet Φ .

forbidden
by the Z_2 symmetry

$$\begin{aligned}
 V = & (m_1^2 + \tilde{\lambda}_1 |\Phi|^2)(H_1^\dagger H_1) + (m_2^2 + \tilde{\lambda}_2 |\Phi|^2)(H_2^\dagger H_2) - (m_{12}^2 H_1^\dagger H_2 + \text{h.c.}) \\
 & + \frac{\lambda_1}{2} (H_1^\dagger H_1)^2 + \frac{\lambda_2}{2} (H_2^\dagger H_2)^2 + \lambda_3 (H_1^\dagger H_1)(H_2^\dagger H_2) + \lambda_4 |H_1^\dagger H_2|^2 \\
 & + \left\{ c_l \left(\frac{\Phi}{\Lambda} \right)^l (H_1^\dagger H_2)^2 + \text{h.c.} \right\} + m_\Phi^2 |\Phi|^2 + \lambda_\Phi |\Phi|^4
 \end{aligned}$$

- The λ_5 term can effectively be generated by a higher-dimensional operator.
- It could be realized by introducing a singlet S charged under $U(1)_H$ with $q_S = q_{H_1}$.

$$V_\Phi(|\Phi|^2, |S|^2) + V_H(H_i, H_i^\dagger) + \lambda_S(\Phi)S^2 + \lambda_H(S)H_1^\dagger H_2 + \text{h.c.}$$

$$\lambda_H = \lambda_H^0 S \quad \lambda_5 \sim \frac{(\lambda_H^0)^2}{2} \frac{\Delta m^2}{m_{\text{Re}(S)}^2 m_{\text{Im}(S)}^2},$$

Relic density (low mass)

Conclusions

- 2HDM may be an effective theory of a high-energy theory and useful to test the underlying theory.
- 2HDM can easily be extended to a gauged model and the $U(1)$ gauge symmetry could be the origin of Z_2 symmetry.
- The $U(1)$ extension to inert doublet model could introduce dark matter candidates whose stability are guaranteed by the remnant symmetry of $U(1)_H$.
- In type-I, a light CDM scenario is possible in the $IDMwU(1)_H$.

Thank you for your attention.
